

Weather Prediction Project

Jeet Banik

09/01/2020

Introduction

This report is related to the “Choose Your Own Project” of the HarvardX: PH125.9x Data Science: Capstone course. In this project, the objective is to use Machine Learning to predict the weather. The original data set can be found using the following link: <https://www.kaggle.com/vonline9/weather-istanbul-data-20092019/data> To provide satisfying results the weather is predicted by using different supervised machine learning algorithms and calculating its accuracy and thus finding the best model for predicting weather more correctly based on the accuracy score.

Analysis

Getting Data

First step in any data analysis project is to get the data. In this project, a dataset “Istanbul Weather Data.csv” is downloaded from Kaggle and analysis is done on it. Required packages are loaded also beforehand.

```
# Dataset links downloadable from Kaggle #  
# https://www.kaggle.com/vonline9/weather-istanbul-data-20092019/data  
# https://www.kaggle.com/vonline9/weather-istanbul-data-20092019/download  
# https://www.kaggle.com/vonline9/weather-istanbul-data-20092019/download/cr3DbJpST7Y7iCmTUn9R%2Fversion  
# Need to login to Kaggle to download the dataset thus didn't download directly in R #  
  
# Load required packages  
if(!require(tidyverse)) install.packages("tidyverse", repos = "http://cran.us.r-project.org")  
if(!require(caret)) install.packages("caret", repos = "http://cran.us.r-project.org")  
if(!require(Amelia)) install.packages("Amelia", repos = "http://cran.us.r-project.org")  
if(!require(mice)) install.packages("mice", repos = "http://cran.us.r-project.org")  
if(!require(e1071)) install.packages("e1071", repos = "http://cran.us.r-project.org")  
if(!require(klaR)) install.packages("klaR", repos = "http://cran.us.r-project.org")  
if(!require(httputil)) install.packages("httputil", repos = "http://cran.us.r-project.org")  
if(!require(class)) install.packages("class", repos = "http://cran.us.r-project.org")  
if(!require(Metrics)) install.packages("Metrics", repos = "http://cran.us.r-project.org")  
if(!require(randomForest)) install.packages("randomForest", repos = "http://cran.us.r-project.org")  
if(!require(ggplot2)) install.packages("ggplot2", repos = "http://cran.us.r-project.org")  
if(!require(ggthemes)) install.packages("ggthemes", repos = "http://cran.us.r-project.org")  
if(!require(dplyr)) install.packages("dplyr", repos = "http://cran.us.r-project.org")  
if(!require(knitr)) install.packages("knitr", repos = "http://cran.us.r-project.org")
```

```
# Get the current working directory to copy the downloaded dataset here to import it
getwd()

# Read the data into a data frame 'df'
df <- read.csv("Istanbul Weather Data.csv")
View(df)
```

Basic Data Analysis

This gives the basic structure and summary statistics of the weather dataset.

```
head(df)
```

```

First Model: Naive Bayes Model

In machine learning, naive Bayes is a conditional probability model: given a problem instance to be classified, represented by a vector representing some n features (independent variables), it assigns to this instance probabilities, for each of k possible outcomes or classes. ### Data Exploration

```
# Create a copy of the original data frame to work with in this model
dat1 <- df

# Data cleaning
dat1 <- dat1[,c(-1,-6:-9)]
dat1$Condition <- ifelse(dat1$Condition=="Sunny", T, F)
dat1$Condition <- factor(dat1$Condition, levels=c(F, T))

head(dat1)
```

```
## Condition Rain MaxTemp MinTemp AvgWind AvgHumidity AvgPressure
## 1 FALSE 0.0 27 22 23 66 1012
## 2 FALSE 0.0 27 22 21 66 1011
## 3 FALSE 0.5 26 22 22 63 1015
## 4 FALSE 0.0 27 22 20 64 1016
## 5 FALSE 0.0 27 23 24 61 1015
## 6 TRUE 0.0 28 24 27 58 1016
```

```
# Convert '0' values into NA
dat1[,2:4][dat1[,2:4]==0] <- NA

# Visualize the missing data NA
missmap(dat1)
```

```
# Use mice function to predict the missing values
m <- mice(dat1[, c("Rain", "MinTemp", "MaxTemp")], method='rf')
```

```
##
## iter imp variable
## 1 1 Rain MinTemp MaxTemp
## 1 2 Rain MinTemp MaxTemp
## 1 3 Rain MinTemp MaxTemp
## 1 4 Rain MinTemp MaxTemp
## 1 5 Rain MinTemp MaxTemp
## 2 1 Rain MinTemp MaxTemp
## 2 2 Rain MinTemp MaxTemp
## 2 3 Rain MinTemp MaxTemp
## 2 4 Rain MinTemp MaxTemp
## 2 5 Rain MinTemp MaxTemp
## 3 1 Rain MinTemp MaxTemp
## 3 2 Rain MinTemp MaxTemp
## 3 3 Rain MinTemp MaxTemp
## 3 4 Rain MinTemp MaxTemp
## 3 5 Rain MinTemp MaxTemp
## 4 1 Rain MinTemp MaxTemp
## 4 2 Rain MinTemp MaxTemp
## 4 3 Rain MinTemp MaxTemp
## 4 4 Rain MinTemp MaxTemp
## 4 5 Rain MinTemp MaxTemp
## 5 1 Rain MinTemp MaxTemp
```

```
##    5    2  Rain  MinTemp  MaxTemp
##    5    3  Rain  MinTemp  MaxTemp
##    5    4  Rain  MinTemp  MaxTemp
##    5    5  Rain  MinTemp  MaxTemp
```

```
m1 <- complete(m)

# Move the predicted missing values into the main dataset
dat1$Rain <- m1$Rain
dat1$MinTemp <- m1$MinTemp
dat1$MaxTemp <- m1$MaxTemp
```

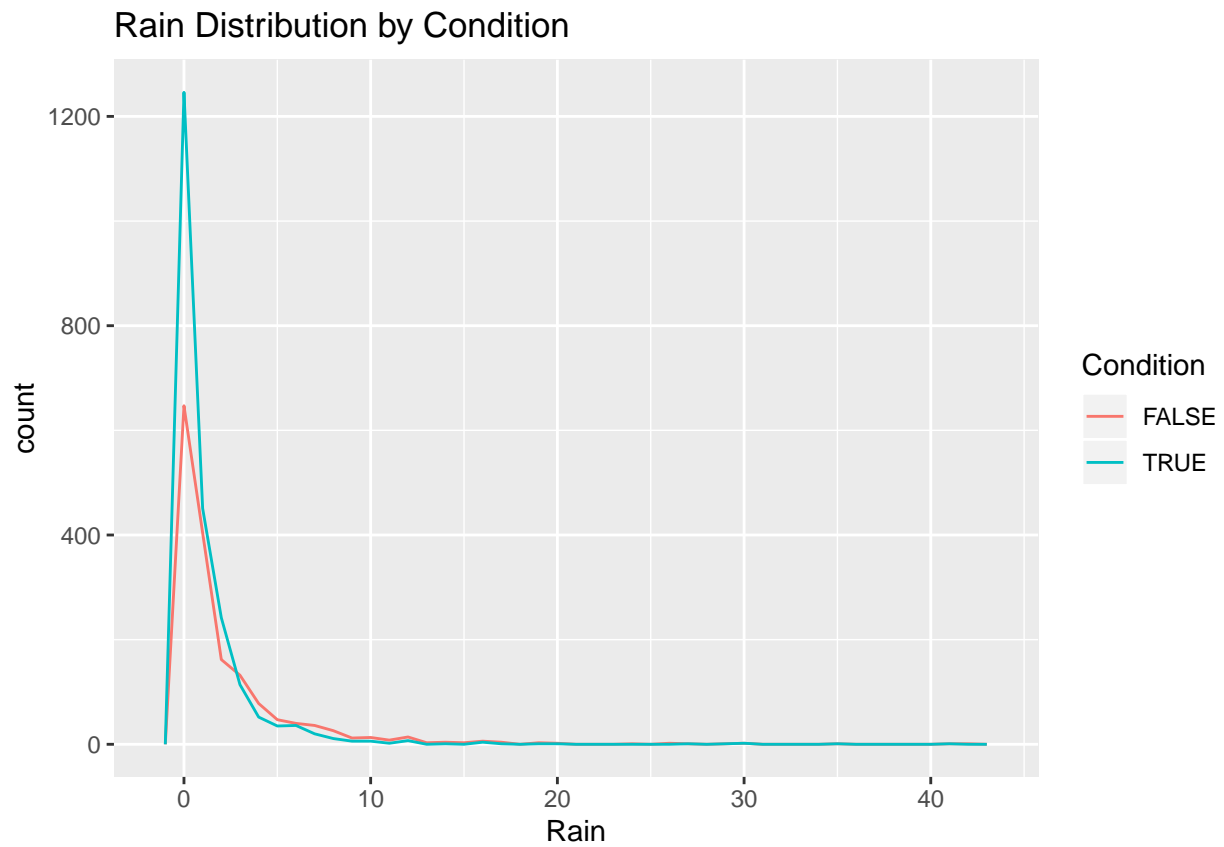

Data Visualization

```
missmap(dat1)
```

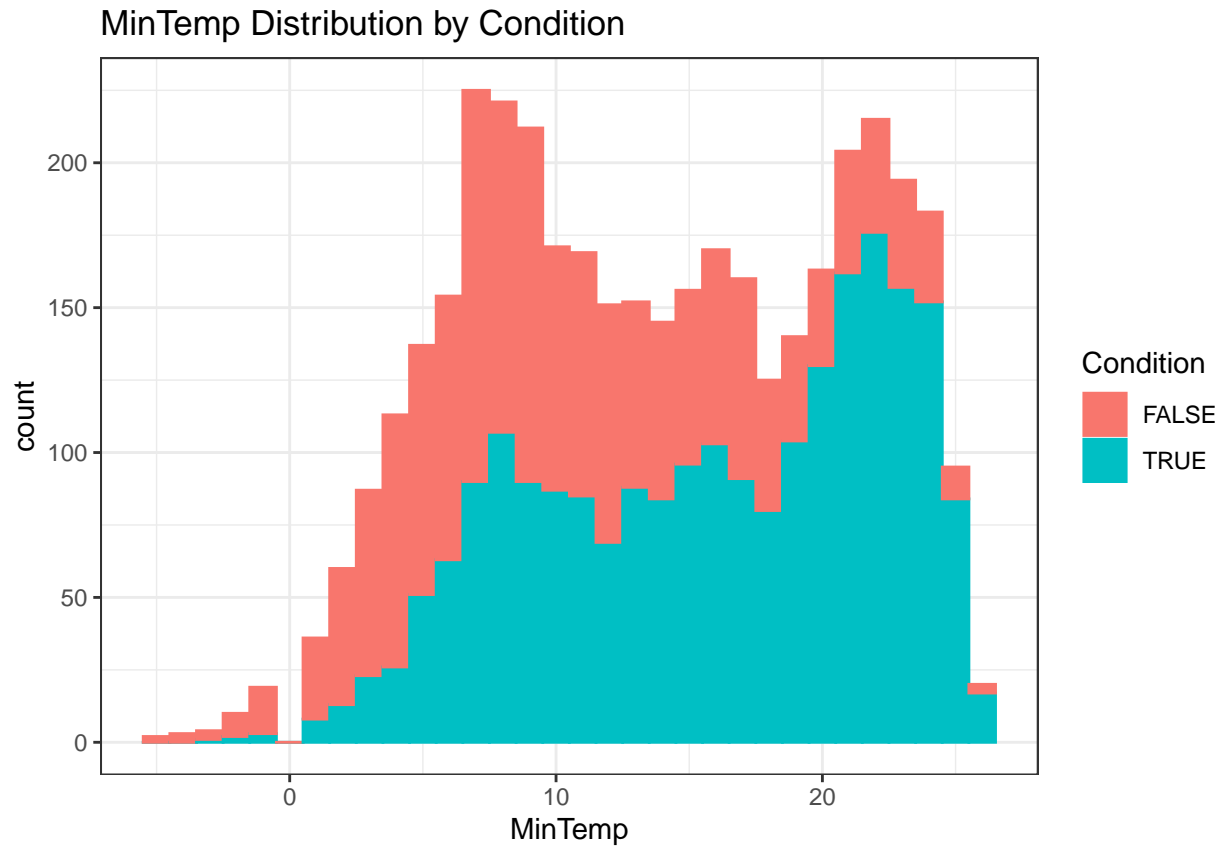

Above plot shows that there are no more missing values in the data frame. Distribution of rain by condition:

```
ggplot(dat1, aes(Rain, colour=Condition)) +
  geom_freqpoly(binwidth=1) + labs(title="Rain Distribution by Condition")
```

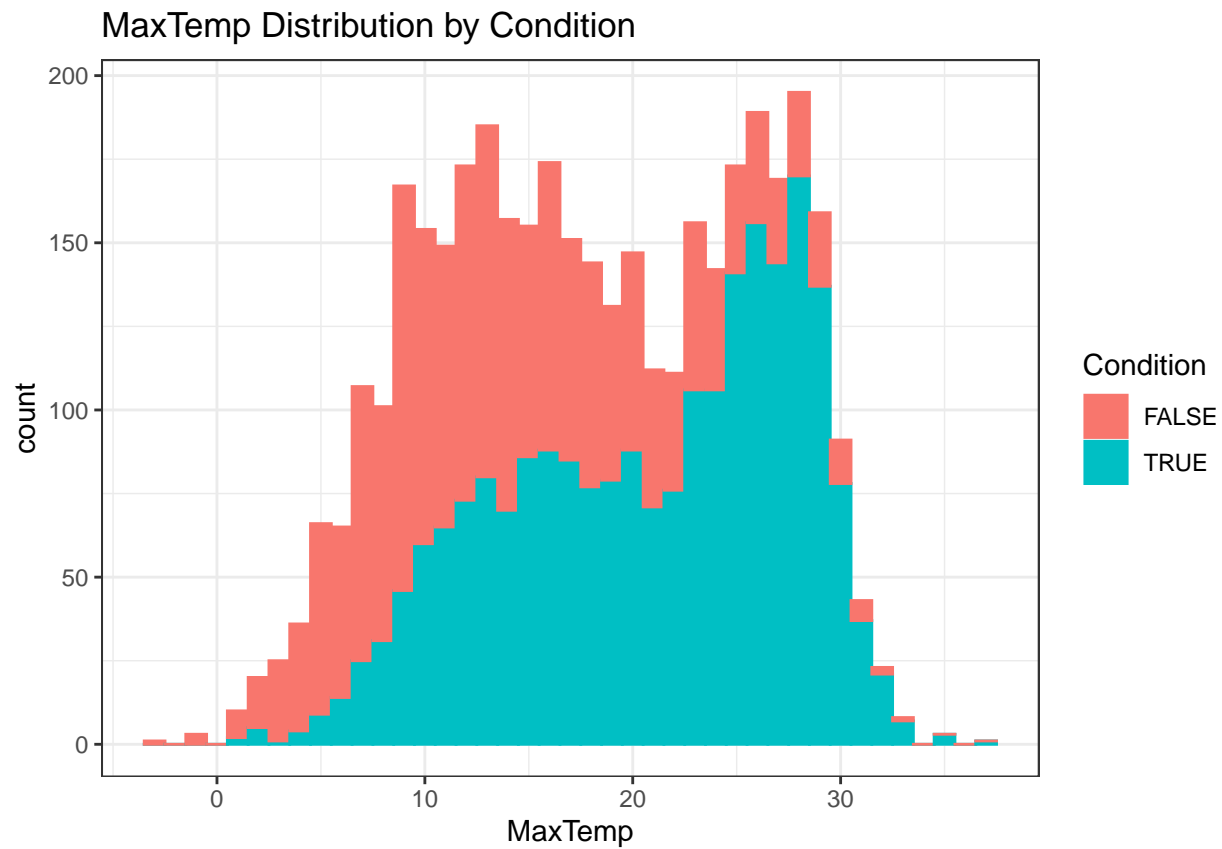

Distribution of minimum tempearture by condition:

```
ggplot(dat1, aes(x=MinTemp, fill=Condition, color=Condition)) +  
  geom_histogram(binwidth=1) + labs(title="MinTemp Distribution by Condition") +  
  theme_bw()
```

Distribution of maximum temperature by condition:

```
ggplot(dat1, aes(x=MaxTemp, fill=Condition, color=Condition)) +  
  geom_histogram(binwidth=1) + labs(title="MaxTemp Distribution by Condition") +  
  theme_bw()
```

Distribution of average humidity by condition:

```
ggplot(dat1, aes(AvgHumidity, colour=Condition)) +  
  geom_freqpoly(binwidth=1) + labs(title="AvgHumidity Distribution by Condition")
```

AvgHumidity Distribution by Condition

Calculate the accuracy of the model's prediction

```
# Split the data into train and test datasets
indextrain <- createDataPartition(y=dat1$Condition, p=0.8, list=F)
train1 <- dat1[indextrain,]
test1 <- dat1[-indextrain,]

# Check dimensions of the split
prop.table(table(dat1$Condition)) * 100
```

```
##
##  FALSE    TRUE
## 42.4538  57.5462
```

```
prop.table(table(train1$Condition)) * 100
```

```
##
##  FALSE    TRUE
## 42.46312  57.53688
```

```
prop.table(table(test1$Condition)) * 100
```

```
##
##  FALSE    TRUE
## 42.41645  57.58355
```

```
# Create objects x and y holding the predictor and the response variables respectively
x = train1[,-1]
y = train1$Condition
```

```
# Apply Naive Bayes
nb_model <- naiveBayes(Condition ~ ., data=train1)
summary(nb_model)
```

```
##           Length Class  Mode
## apriori      2      table numeric
## tables       6      -none- list
## levels       2      -none- character
## isnumeric    6      -none- logical
## call         4      -none- call
```

```
# Predict test set
```

```
predict <- predict(nb_model, newdata=test1[-1])
```

```
# Get the confusion matrix to see the accuracy value and other parameter values
```

```
new1 <- data.frame("Rain"=44,"MaxTemp"=29,"MinTemp"=23,"AvgWind"=19,"AvgHumidity"=57,"AvgPressure"=1017)
c1 <- predict(nb_model, new1)
```

```
if (c1==TRUE) {
  print('Sunny')
} else {
  print('Rainy')
}
```

```
## [1] "Rainy"
```

```
# Calculate the accuracy
```

```
a1 <- mean(test1[,1]==predict)
a1
```

```
## [1] 0.7133676
```

A data frame 'acc' is created to store the accuracy scores.

```
acc <- data.frame(Method="Naive Bayes Model", Accuracy=a1)
acc
```

```
##           Method Accuracy
## 1 Naive Bayes Model 0.7133676
```

Second Model: KNN Model

The k-nearest neighbors (KNN) algorithm is a simple, easy-to-implement supervised machine learning algorithm that can be used to solve both classification and regression problems. The KNN algorithm assumes that similar things exist in close proximity. In other words, similar things are near to each other. ###
Data Exploration

```
# Create a copy of the original data frame to work with in this model
dat2 <- df
```

```
# Data cleaning
```

```
dat2 <- dat2[,-1]
dat2$AvgWind <- as.numeric(dat2$AvgWind)
dat2$MoonRise <- as.numeric(dat2$MoonRise)
dat2$MoonSet <- as.numeric(dat2$MoonSet)
dat2$SunRise <- as.numeric(dat2$SunRise)
dat2$SunSet <- as.numeric(dat2$SunSet)
dat2$Rain <- as.numeric(dat2$Rain)
dat2$MinTemp <- as.numeric(dat2$MinTemp)
dat2$AvgHumidity <- as.numeric(dat2$AvgHumidity)
dat2$MaxTemp <- as.numeric(dat2$MaxTemp)
dat2$AvgPressure <- as.numeric(dat2$AvgPressure)
```

```
head(dat2)
```

```

## 1 Naive Bayes Model 0.7133676
## 2           KNN Model 0.6384615
```

Accuracy decreased significantly and thus another model is implemented for prediction. ## Third Model: Random Forest Model Random forests, otherwise known as the random forest model, is a method for classification and other tasks. It operates from decision trees and outputs classification of the individual trees. Random forests correct for the habit of decision trees to overfit to their training set. ### Data Exploration

```
set.seed(100, sample.kind="Rounding")

# Create a copy of the original data frame to work with in this model
dat3 <- df

# Data cleaning
dat3 <- dat3[,-1]
dat3$Condition <- ifelse(dat3$Condition == "Sunny", 1, 0)
dat3$Condition <- factor(dat3$Condition, levels = c(0, 1))
```

```

## 2 KNN Model       0.6384615
## 3 Random Forest Model 0.8198043
```

Results

We can check the accuracy scores for the various models trained from Naive Bayes Model, KNN model and Random Forest Model. The resultant accuracy of predictions for all the four models are as follows:

##	Method	Accuracy
## 1	Naive Bayes Model	0.7133676
## 2	KNN Model	0.6384615
## 3	Random Forest Model	0.8198043

As we see from the results, Random Forest Model is the most accurate model in predicting the weather dataset with an accuracy score of 0.8198043, which means the predictions of this model has an accuracy of 81.98% or ~82%.

Conclusion

For predicting the weather dataset, 3 separate machine learning models are used in this project and each of its accuracy scores are calculated and compared to find out the best model for weather prediction here. The first model, Naive Bayes Model, scored an accuracy of 0.7133676 which is a decent score but yet needs to be improved. The second model, KNN Model, scored an accuracy of 0.6384615 which decreases the accuracy score from the previous model significantly and thus should not be taken into consideration. The third and final model, Random Forest Model, scored an accuracy of 0.8198043, which has improved by a lot compared to the previous model and is the best out of all the models used here. Thus, the Random Forest Model, with an accuracy of 81.98% or ~82%, should be considered for predicting the weather dataset most correctly. Other different machine learning models could also improve the results further, but hardware limitations, such as the RAM, are a constraint.
